

**Claims**

1        1. A cellular radio telecommunications network, in which physical channels may  
2        be reused in the same cell, reused channels on the up link being differentiated by a time  
3        shift between them.

1        2. A network as claimed in claim 1, wherein the reused channels use a common  
2        clock signal.

1        3. A network as claimed in claim 1 or 2, in which timing advance information for  
2        each base station reusing a channel is transmitted on the down link.

1        4. A network as claimed in claim 1 or 2, wherein the reused channels all use the  
2        same signature.

1        5. A network as claimed in claim 1 or 2, including a master base station and a co-  
2        located slave base station, wherein the master base station generates a common reference  
3        clock and the slave base station uses a shifted reference clock to send time shift  
4        information to the mobiles.

1        6. A network as claimed in claim 1 or 2, a base station having two receivers  
2        operating with mutually shifted time references.

1        7. A network as claimed in claim 1 or 2, wherein the time shift is longer than the  
2        propagation delay in the reused channels.

1        8. A network as claimed in claim 1 or 2, wherein the time shift is approximately  
2        equal to the guard interval.

1        9. A method of operation a cellular radio telecommunications network, in which  
2        physical channels may be reused in the same cell, reused channels on the up link being  
3        differentiated by a time shift between them.

1           10. A method as claimed in claim 9, wherein the reused channels use a common  
2 clock signal.

1           11. A network as claimed in claim 9 or 10, in which timing advance information  
2 for each base station reusing a channel is transmitted on the down link.

1           12. A network as claimed in claim 9 or 10, wherein the reused channels all use the  
2 same signature.

1           13. A method as claimed in claim 12, wherein a master base station generates a  
2 common reference clock and a co-located slave base station uses a shifted reference  
3 clock to send time shift information to the mobiles.

1           14. A method as claimed in claim 13 wherein two receivers at a base station  
2 operate with mutually shifted time references.

1           15. A method as claimed in claim 9 or 10, wherein the time shift is longer than the  
2 propagation delay in the reused channels.

1           16. A method as claimed in claim 9 or 10, wherein the time shift is approximately  
2 equal to the guard interval.

1           17. A protocol for carrying out all the steps of the method of any of claims 9 or 10.

1           18. A computer program for carrying out all the steps of the method of any of  
2 claims 9 or 10.
